

HUMAN-COMPUTER INTERACTION PROJECT

Shopping website that sells Apple products.

RANA İLKİM
SELİM SEVİNÇ

In this project, our goal was to design a Apple product selling store's website. This store named "Sakura Store" only takes orders, payment is after the order.

We learned how to design a website with PHP, HTML, CSS and connecting the website to the database. We considered human-computer interaction rules, laws, and standards.

First, we talked about the programming schema. We discussed whether to choose Microsoft Access or PHP to code this program. We wanted to create and design a database in Microsoft Access so every user and what they buy would be recorded in the system. But we changed our mind to using MySQL database and connecting to it via PHP. We were experienced with connecting to a database and designing its GUI by using PHP, HTML and CSS languages.

We used dark and bright colors, bold type, and size to distinguish parts of text or an image and create contrast. Our all pages have headings to create contrast with the text. Banner is black, background is white, text boxes are grey and buttons are blue and red to create contrast and make it easier to draw attention of the user. We chose all our images similar and arranged them in the same size to create repetition.

When the user first enters the website, there is a sign up page. User enters their information and their account is created and recorded in the database. So if the user wants to log off and login again, they don't need to sign in again.

User can change their password. It is updated in the database too. Old password is changed in order to guarantee cyber security.

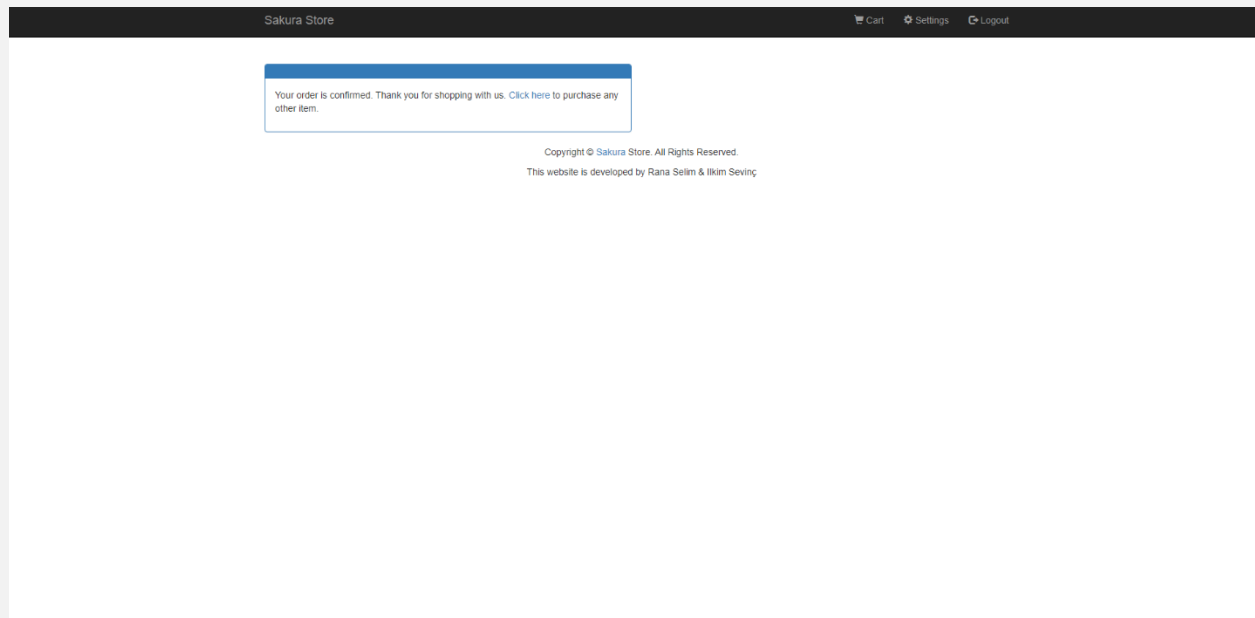

User lands here when they press “Sakura Store” button on the left and sees the product types the store sells. Pressing “Shop Now” button makes the user go to the products page.

After pressing “Shop Now” user lands here. Here user can press “Add to Cart” and the product is added to the cart.

User can see their cart by pressing “Cart” button on the right part of the banner. User can remove what they want to buy or confirm their order. Our store doesn’t use credit card or any payment method before delivering son o payment method is asked here.

After confirming the order, user sees this pop-up box. By pressing “Click Here” user returns to the homepage and can purchase other products.
